

PEECO HIGH TEMP

High Temperature Flow Switches

Maximum temperature: 1500°F (available on all models)

Peeco High Temperature flow switches are specially designed for use at elevated temperatures, the PEECO flow switch can be supplied with a variable length convoluted stainless steel body extension. This “finned” stainless steel body extension will protect the electrical contacts and permit rapid heat dissipation from process conditions. When used in conjunction with our high temperature micro-switch, this flow switch provides superior performance at temperatures other switches only dream about. Available on explosion-proof, non-explosion proof and high pressure models.

Supplied with a variable length of convoluted stainless steel body extension permitting rapid-heat dissipation. This inhibits the high heat from passing through the body and into the electrical components located in the topworks.
